Canonical Core refresh required by Nagare Slice 2

2026-09-06

1 Decision and authority

The user requires one current `hymeko_core` identity throughout the HyMeKo–Graph–Nagare chain and has explicitly authorised carrying the canonical integration through. The existing Graph checkout was first fetched and fast-forwarded without creating a worktree. At entry, Graph `main=origin/main=2b619a39` is clean, but its sole root manifest still pins Core `92383b38`; canonical Core is `main=origin/main=fc3eda9b`. This boundary performs only that provider refresh and its generated lockfile update.

2 Scope and ownership

Owned paths are `Cargo.toml`, `Cargo.lock`, this plan bundle, and one result report. No graph algorithm, public API, IR type, benchmark, dataset, or Nagare production path changes here. No new worktree, dependency family, or source alias is introduced. If Cargo resolves more than one HyMeKo/Core identity, or moves unrelated packages, the update is rejected and reduced.

3 Execution

1. Replace the single `hymeko_core` revision by `fc3eda9b73e4f171aada5c79751af481759c068e`.
2. Regenerate only the corresponding lock entry and inspect the exact diff before continuing.
3. Run locked metadata and prove one `hymeko_core` instance.
4. Run the focused direct-IR tests, then full workspace tests, clippy, formatting, and governance gates.
5. Commit and push only if every new failure is absent or demonstrated as entry-baseline-equivalent. Re-fetch and verify local equals remote.
6. Only then advance both Nagare Graph declarations together and re-run Nagare's single-instance gate before Slice 2 implementation.

4 Acceptance and rollback

Acceptance requires Graph and its lock to resolve exactly one Core at `fc3eda9b`, no duplicate `hymeko_*` package, unchanged graph behaviour, and a clean scoped diff. The rollback unit is the single dependency commit; no history rewrite or broad restore is permitted.

5 Scientific boundary

This is dependency provenance, not a performance result. It neither modifies nor reinterprets the published walk-enumerator measurements, and it does not authorise the historical nine-repetition P2-C campaign.
